Project Objective:

Implement a system based on object-oriented programming that fulfills the 12 functional requirements described above, adapting their business logic to a minimarket of disposable products (cups, plates, food containers, cutlery, etc.), ensuring inventory control, profitability, expiration traceability, customer loyalty, fiscal management, and cash register security.

Description:

The project consists of developing an object-oriented system that allows a minimarket specialized in disposable items (such as plates, cups, food containers, trays, plastic or bioplastic cutlery, etc.) to efficiently manage its key operations: sales, inventory, suppliers, promotions, reservations, expiration control, customer loyalty, and taxation.

Although the products are not perishable in the traditional sense (food), many disposable items may have an expiration date (for example, bioplastics that degrade, packaging that loses properties, or health regulations that limit their useful life), so the system must handle expiration alerts and progressive discounts.
